Radon

Termites

Mold

-
- Radon causes Lung Cancer and over 21,000 deaths per year. Louisville has been classified as Zone 1 (which is the most dangerous classification) by the EPA. Zone 1 indicates the average level of radon measured in homes is above 4.0 pCi/L (Pica-curies/Liter). A family home with a radon level of 4.0 pCi/L is equivalent to each member of the family smoking 8.2 cigarettes per day. All homes in the Louisville area should be tested for radon.
 - Subterranean termites are by far the most destructive termite species. The hard, saw-toothed jaws of termites work like shears and are able to bite off extremely small fragments of wood, one piece at a time. Over time, they can collapse a building entirely, meaning possible financial ruin for a homeowner.
 - Is mold in crawl space dangerous? Be it in black, white, or yellow, mold that appears in crawl spaces can be dangerous. They can cause significant damage to your property, lead to its deterioration, and reduce your home's value.

What can RTM Healthy Home Pros do for your clients?

Our goal is to help home inspectors and realtors provide their clients with information they need regarding any radon, termites, and mold issues in any home they may be buying or selling. We provide thorough digital radon gas testing, WDI inspections, mold testing, and free mold mitigation estimates. By partnering with RTM Healthy Home Pros, we help you ensure your client buys a healthy home, not a sick one.
